Locking Technology in Doors

Plan • Design • Realise

Technik für Tür
The door handle (or door latch) is one of the most frequently used functional elements in the home: it’s the very first object that people make contact with when they enter a building and it hardly ever comes to rest in busy places.

A classic with value added: the advantage of the u-shaped handle lies in the second 90 degree bend. It was used traditionally to prevent people or material from getting "threaded on". The rear bend helps to prevent shopping bags or coat sleeves from getting caught in the handle. The u-shaped handle also has comfort qualities, because the rear turn supports the ball of the hand when opening the door.

In their efforts to lower house construction prices and rents in the 1920s, many architects became involved with the standardization of construction components. The ProLock-200 is a variation of the draft that once made a name for itself as the Frankfurt standard handle where a round rod was bent to 90 degrees and positioned on a simple rosette.

European Standard EN 1906 defines the utilization classes for door handle and handle systems. These classes depend on the intensity of use and level of care exercised by the users. Hettich only offers handle systems in all utilization categories.

Utilization Categories:

- **Class 1: HOME**
  - Moderate utilization by persons motivated to exercise great care and from whom there is a low risk of improper use. Typical areas of application: interior doors of residential buildings.

- **Class 2: OFFICE**
  - Moderate utilization by persons motivated to exercise care but from whom there is a certain risk of improper use. Typical areas of application: interior doors of office buildings.

- **Class 3: PUBLIC PLACES**
  - High utilization by the general public or other persons with low motivation to exercise care and from whom there is a high risk of improper use. Typical areas of application: interior doors of office buildings open to the general public.

- **Class 4: STADIUM / PUBLIC TOILETS**
  - For use in doors that are frequently subjected to violence or damage. Typical areas of application: Cricket & Football stadium, barracks or public toilets.
Even though door handles are subject to fashion trends, there are still number of classics or even archetype which can have an aesthetically striking effect on the first contact with a building. Hettich focuses on timeless and functional classics in its product range. They are always available for profile frame doors too (OVR oval rosette handle) and as protective door handle sets.

**ProLock–100 Archetype: U-shaped handle**
- A classic with value added: the advantage of the u-shaped handle lies in the second 90 degree bend. It was used traditionally to prevent people or material from getting “threaded on”. The rear bend helps to prevent shopping bags or coat sleeves from getting caught in the handle. The u-shaped handle also has comfort qualities, because the rear turn supports the ball of the hand when opening the door. Hettich has the u-shaped handle in its product range as factory design draft ProLock–110.

**ProLock–200 Archetype: Frankfurt standard L-shape handle**
- In their efforts to lower house construction prices and rents in the 1920s, many architects became involved with the standardization of construction components. The ProLock–200 is a variation of the draft that once made a name for itself as the Frankfurt standard handle where a round rod was bent to 90 degrees and positioned on a simple rosette. All of the Frankfurt versions are based on the idea of the right angle. Hettich has included the Frankfurt standard handle in its product range in a high-quality modern interpretation as factory design draft ProLock–210.

**ProLock–300 Archetype: Frankfurt mitred handle**
- The ProLock–300 is a variation of a geometric handle draft design from the 1920s which stands out through the legible simplicity of the construction: a circular tube is separated with a mitred cut before the two halves are joined together again at right angles. This handle was given the attribute “Frankfurt” not only through its close geometric relationship with the Frankfurt standard handle but also because it was used when the Frankfurt Architecture Museum was built. Hettich has included its interpretation of the Frankfurt mitred handle in its product range as factory design draft ProLock–310.

**ProLock–400 Archetype: Ulm handle**
- Made for getting to grips with! The archetype of this u-shaped handle was named after the Ulm School of Design where it was first used in the 1950s. The draft was based at the time on the door handles of the trains run by the Swiss railway. Hettich reworked the Ulm handle with its own factory design version ProLock–400.

**ProLock–500 Archetype: Hand–shape handle**
- As far as the typology is concerned, this handle constitutes a connection between the Frankfurt mitred handle and the Ulm handle. The design of this factory design draft ProLock–500 is discreet, easy to grip and orientated towards the direction of movement.
Mortise Handles & Knobs

- Technology Behind Handles

**ProLock 4 - Premium handles with ball-bearing technology**

ProLock 4 -bearing

These high-end project handles are characterized by an industrial ball bearing. The precise and maintenance free ball bearing technology ensures a well-balanced system. Additionally the flex-bearing, lying inside the ball bearing unit, balances uneven door surfaces for up to 3 degree. This premium and innovative solution will meet all standards for private or public doors.

- EN 1906, class 4
- With spring and 90 degree carrier
- Patented flex-bearing unit
- 1 million cycle tested

**ProLock 3 - Handles with friction bearing technology**

ProLock 3–bearing

The main characteristic of this handle is a maintenance free nylon bearing that is floating on the steel base rose and balancing radial and axial free-play. This class 4 handle bearing can be used on doors with high frequency and a potential for violent usage such as in schools or Cricket & Football stadium.

- EN 1906, class 4
- Unsprung
- 200,000 cycle tested

**ProLock 2 - Handles with standard friction bearing technology**

ProLock 2–bearing

The bearing made of glass fiber reinforced nylon is guiding the handle axial as well as radial. A wave spring is compensating angular tolerances. A perfect and certified price/performance ratio for frequently used handles in all kind of buildings.

- EN 1906, class 3
- With spring
- 200,000 test cycles

**ProLock 1 - Handles with standard friction bearing technology**

ProLock 1 –bearing

The steel base rose and return spring ensure a proper and stable fixing on the door. The economic bearing is perfect for interior doors in public buildings or private

- With spring
- 200,000 internal test cycles

www.hettich.com
All Mortise locking system has three components i.e. Mortise Handle, Mortise Lock Body and Euro Profile Cylinder. Hettich provides you with an option to choose all three according to application and aesthetic.

Hettich Mortise locking system:
Mortise Handle & Knobs

- Handles in all versions

**Rosette handles**

- Classic for apartment doors is the two-piece rosette handle which is available with a handle or a round or flat knob. The rosette that goes with it comes in warded lock, oval hole or profile cylinder versions.

**Oval rosette handles**

- Oval rosettes are used on profile frame doors made of steel, plastic or aluminium. They permit the mounting of the handle onto narrow frame profiles which conceal the risk of hand injuries, which is why the use of offset handles is recommended.

**Long and short plate handles**

- With long and short plate handles, the handle and keyhole are covered by a single continuous plate. This combination provides additional hold for the handle on the door and additional screw attachment options. This makes these handles suitable for high levels of wear and tear, such as in schools.

**Protective handles**

- Protective handles on exterior doors provide the prerequisites for break-in security. They are bolted through the door, thus providing good break-in protection. The standard DIN 18257 splits protective handles into resistance classes from ES 0 to ES 3, whereby ES 3 covers protective handles which are extremely resistant to break-ins. Available with an optional cylinder protection system.

**Window handles**

- Hettich offers a range of window handles to match its programme of classical door handles. This guarantees that houses and apartments can be fitted out in a uniform form language in high-grade stainless steel with a satin surface.

www.hettich.com
Panic bolting technology ensures that people can get out of a danger zone at any time, even in a panic situation. One push on the horizontal activation element is all it takes and the door springs open – irrespective of whether it was locked or not.

Hettich unlocking solutions also open up the escape route when a crowd of people press against the door. And even the strength of a child is sufficient to open the door to escape from a fire or toxic smoke.

Bolting technology satisfies European standards EN 1125 (Panic locks with horizontal activation bars) and EN 179 (Emergency exit locks with handles or impact plates) – and demonstrates the company's expertise. The lock and release element are developed and manufactured in coordination with one another.

With panic systems in particular, it is important to perceive the door as a system, because it’s not only the panic lock, door lock and fitting that have to interact perfectly so that the door can help in a life-threatening situation. The door closer and hinges have a decisive influence on the ability to satisfy the high demands set by the standard.
The type of room and utilization of the building are decisive when choosing the right panic door combination. European standards DIN EN 1125 and DIN EN 179 define the fittings of panic doors and emergency exits. Emergency exit locks in compliance with DIN EN 179 are not normally subjected to use by the general public.

It is assumed here that the users of the building are acquainted with the escape routes, so conventional panic lock technology with a handle or impact plate are sufficient here. Panic locks with a horizontal activation bar in accordance with DIN EN 1125, on the other hand, are intended for use in buildings frequented by the general public. Our panic systems in conformance with DIN EN 1125 ensure that persons who have panicked and are not acquainted with the functions of the door can always get out of the building safely.

### Panic locks with a horizontal activation bar
- Panic locks in accordance with DIN EN 1125 are used in public buildings in which the users are not acquainted with the functioning of the escape door but must nevertheless be able to operate them without instruction.
- Panic locks activated mechanically by means of a horizontal handle or push-bar.
- **Areas of application:**
  - Hospitals and clinics
  - Escape routes in schools and training centres
  - Public administration buildings
  - Stadia, arenas and events buildings
  - Shopping centres
- Users have no advance knowledge of how to open the escape door.

### Emergency exit locks with door handle
- Emergency exit locks in accordance with DIN EN 179 for buildings or building sections not open to the general public and all areas where access by the general public can be excluded. Side entrances or doors in these buildings or building sections are only used by authorized persons.
- Emergency exit locks operated mechanically by means of a handle or impact plate.
- **Areas of application:**
  - Private residential complexes
  - School classrooms
  - Non-public administration buildings
  - Non-public areas of airports, banks, shopping centres
  - Non-public areas of administrative buildings
- Users have no advance knowledge of how to open the escape door.
Panic Function E – Alternating function

Panic Function E is intended for buildings with access for a defined group of people. A blind plate or knob is mounted on the outside and the door can only be opened with a key. Conventional panic function per handle from the inside.

Area of application: heating room access doors, elevator systems, underground/multi-storey carparks, storage and commercial buildings, entrance doors in rented apartment complexes and blocks of flats.

Panic Function D – Transit function

Panic Function D is intended for doors with a pure escape function which are not used otherwise. When the conventional panic function is activated from the inside, the door is opened and the outer handle is engaged as well. In this setting, the door does not constitute an obstacle when entering the building or escaping from it. The original function can be reset with a key. The coupling is mechanical via a two-part hub.

Area of application: escape doors in administration/office buildings, retirement homes, side entrance doors (e.g. schools and hotels).

Panic Function B – Switchover function

Panic Function B with a handle on both sides is designed for buildings open to the general public. While the handle on the inside has a conventional panic function, the outside handle can be engaged or disengaged mechanically as required. The two handles are coupled via a two-part hub.

Area of application: escape doors in administration buildings, retirement homes, side entrance doors (e.g. schools and hotels).

Panic Function C – Forced closure function

Panic Function C with a handle on both sides is designed for buildings open to the general public. While the handle on the inside has a conventional panic function, the handle on the outside is disengaged as standard (idle function) and a key position (open position) must be used to engage and disengage it (forced closure). However, the key can only be removed after the idle function has been set again.

Fields of application: doors in administration or office buildings, retirement homes, side entrance doors (schools or hotels).
Panic, Lock & Bolting Technology

Panic Bars

HPN- 3000 RIM EN Version (Touch Bar Panic Device)

Product characteristics

- Mode of operation: Touchbar
- Lock type:
  - Single-leaf 1 point locking
  - Single-leaf 2 point locking
- Fixing axis: 1.000 mm*
- Screw-on or screw through version
- Left / Right same version
- Door Material: Steel, Wooden, Profile Framed
- Finish: Stainless steel & Aluminium

Hettich can look back on many years of experience in the development and manufacture of locks. These locks provide the highest possible level of security and reliability in all areas and function as precisely as clockwork. Long-lasting functionality and a long service life are guaranteed by state-of-the-art manufacture using high-quality materials and construction measures. As panic locks, locks correspond with horizontal panic triggering elements and conventional fittings in the ideal manner. A defined trigger impulse ensures that the door springs open abruptly.

### Master key system

- One present key needed to open any door in the house or company.
- Access can be set based on staff position.
- Suitable for all kinds of locks.
Optional silencing
- Locks have the option of silencing by means of a sound insulating rubber element on the latch bolt. Another speciality is an integrated oil channel that lubricates all of the moving parts of the lock. No additional recesses in the lock pocket are required because all DIN dimensions are complied with.

Triple latch bolt
- Instead of hitting the strike plate, the triple latch bolt is pressed back into the lock by a lever mechanism. An additional milling groove should be cut in the lock pocket to install the crank latch.

Spring hub
- A spring in the handle hub jams the pinion of the handle. This results in the precise guiding of the split spindle and thereby the door handle. Tolerances are compensated. The hub is smoothly mounted in a wear resistant plastic bearing. Mortise locks with sliding bearings provide the best possible ease of operation, even when used intensively.

Protection bushings
- Hettich offers locks with protection bushings fitted in the standard lock attachment drill holes to prevent wood or metal drill shavings from falling into the locking mechanism during assembly and impairing its functionality.

Locks and strike plates for all notch types
- Mortise locks with a face plate mounted on one side and angular striking plates are required for rebated doors. A mortise lock with a centred face plate and flat striking plate is required for flush edge doors.

Mortise locks left/right
- Mortise locks are designated in accordance with DIN 107 from the side of the door where the hinges are visible. Hinges visible on the left side = DIN left, hinges visible on the right side = DIN right.
Sash Lock

- Lock type: PZ - 72 W (W = handle/knob execution)
- Backset: 55/60 mm
- Face plate: Stainless steel
- Face plate width: 24 mm / Hub: 8 mm
- With closed lock case with 3-fold fastening
- Lock case: zinc-plated
- For doors with high frequency
- Shiftable latch bolt. Latch bolt can be shifted without opening the lock case.
  With silencing elements.
- Striking plate, white plastic box and screws included.
- Left / Right same version
- Door Material: Steel, Wooden Doors
- Finish: Stainless steel, Antique Brass* (On special order)

**ProLock Infinity Lock System**:
Main Door locking solution having a combination of mortise and night latch lock system.

**Technical detail in brief**:

- **Handle**:
  - Fixed handle outside: Operable only by key from outside
  - Manual locking
  - Cylinder Protection (anti drill protection for 10 pin cylinder)
  - Returning Spring
  - DIN Left/Right different model
  - Door Thickness 50–60 mm
  - Material: Stainless Steel 304

- **Lock Body**:
  - Centre to centre distance 68 mm
  - Backset 60 mm
  - Life time cycle: 200,000 cycles tested
  - Material: Stainless Steel 304 (faceplate)

- **Euro Profile Cylinder**:
  - ProLock Infinity High security thumb turn 70 mm cylinder with computerized snake key way and anti drill pins

**Available finishes**:
- Stainless Steel, Antique Brass, Champagne & Black

* Against Special Order
Terminology Related to ProLock Infinity

How to determine if the door is DIN Left or DIN Right

What is DIN Left And Right:
- DIN Right/Left denotes the direction of the opening of the door.
- DIN Left: When the hinges are placed to the left of the door leaf, then the door is opened DIN left.
- DIN Right: When the hinges are placed to the right of the door leaf, then the door is opened DIN right.

Why we need DIN Left/Right versions?
- It is required as the outer handle is fixed and only operable with key that means only inside handle will be moving and hence we need to have different handles motion for DIN Left/Right opening doors from inside.

How to decide article no. while placing Order?
- If a person will be using leftward opening door then DIN left will be used. Article no: 9228485 (For SS Finish only)
- If a person will be using rightward opening door then DIN right will be used. Article no: 9228501 (For SS Finish only)

ProLock Infinity : The Complete Main Door Solution
